FEATURE:
OTHER INFORMATION: Chimeric peptide consisting of amino acid sequence 947-967 of t
OTHER INFORMATION: Chimeric peptide consisting of amino acid sequence 947-967 of t
OTHER INFORMATION: Tetanus toxoid precursor (Tentoxylysin) linked by a spacer to a
OTHER INFORMATION: acid sequence 2-10 of the GnRH hormone
NAMB/KEY: MOD RES
LOCATION: (1) - (1)
OTHER INFORMATION: Amidated phenylalanine
NAMB/KEY: PEPTIDE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     LOCATION: (1)...(21)

                                                                                                                                                                                                                  ö
                                   The invention relates to a synthetic immunogen for inducing specific antibodies against gonadorropin releasing hormone (GnRH also known as luteinishing hormone releasing hormone, LHRH) comprising a fusion peptide which comprises a promiscuous helper T-cell peptide epitope and immunomimic peptide epitope or its analogue. The synthetic immunogen is useful inducing an immune response against GnRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, therus and other gynaccological cancer), endometriosis, uterine fibroids, benign prostatic hypertrophy and prostate cancer. The immunogen is effective in eliciting high and specific anti-GnRH antibody titres. The present sequence is a synthetic immunogen of the invention

Novel synthetic immunogen for inducing immune response against gonadotropin releasing hormone, comprises fusion peptide having promiscuous helper I-cell peptide epitope and immunomimic peptide epitope or its analog.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a synthetic immunogen for inducing specific antibodies against gonadotropin releasing hormone (GnRH also known as luteinising hormone releasing hormone, HRRH) comprising a fusion peptide which comprises a promiscuous helper T-cell peptide epitope and immunomimic peptide epitope or its analogue. The synthetic immunogen is useful inducing an immune response against GnRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other gynaecological cancer), prostate cancer. The immunogen is effective in eliciting high and specific anti-GnRH antibody titres. The present sequence is a synthetic immunogen of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Helper T cell epitope; universal immune stimulator; invasin; hapten; vaccine; LHRH; luteinising hormone releasing hormone; prostate; androgen-dependent carcinoma; antitumour; infertility; tetanus toxin.

                                                                                                                                               synthetic immunogenic peptides are protect in which a universal immune stimulator is linked to a peptide or protein hapten containing soll and/or cytotoxic T lymphocyte epitopes, giving a product which causes of potent immune responses to the coupled peptide or protein. The stimulator consists of (A) a promiseuous halper T cell epitope (Th) which elicits an immune response to the coupled peptide in members of a heterogeneous population expressing diverse HiA phenotypes, and (B) an adjuvant peptide sequence from the invasin protein of yersinia Spacer amino acid commains and between the immune stimulator and hapten components. When the hapten is LHRH, then optionally the invasin domain can be omitted from the immune stimulator and hapten components an LHRH. Containing, invasin-free immunogenic peptide as above which can be used as a potent vaccine for treating e.g. prostatic hyperplasia, androgence dependent carcinoma, prostatic carcinoma, testicular carcinoma, androgence endometriosis, benign uterine tumours, recurrent functional ovarian
                                                                                                                                         Synthetic immunogenic peptides are provided in which a universal immune

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenize cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human proteits especific membrane antigen (PSM), hereapolla? (Her2) and/or fibroblast growth factor 8b (PGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL cytocoxic T-lymphocyte) croup derived from the PA and/or at least 18-cell group derived from the cell-associated PA, and (2) at least 1 E-cell group derived from the cell-associated PA, and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of the respective PA and including at least one foreign T helper epitopes are also claimed. The method is used to treat prostate, prostate, breast or respective PA and including to the treat prostate, prostate, breast or breast cancer when the PA is human PSM, FGP8b and Har2, respectively. Which appears on pages 184-187 of the bard of the wild type human PSM (AAY92619), which appears on pages 184-187
                                                                                                                                                                Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                        ઠે
                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                             The invention relates to inducing an immune response against autologous carcinoembryonic antigen (CEA) in an animal, e.g. human. The method involves effecting uptake and processing by antigen presenting cells (APCS) in the animal of at least 1 modified CEA polypeptide or of a mucleic acid encoding the modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide to induce a CTL response and an antibody response that targets the autologous CEA. The method is useful in immunizing actively against diseases characterized by cells that express CEA. The present sequence represents a truncated human CEA polypeptide that has tetanus toxoid (TT) P2 and P30 epitopes introduced
                                                                                                                                       Inducing an immune response in humans against autologous carcinoembryonic antigen (CEA) comprises administering a modified CEA polypeptide, a nucleic acid encoding the polypeptide, or a microorganism expressing the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CBA; immune response; carcinoembryonic antigen; antigen presenting cell; APC; cytostatic; vaccine; human; tetanus toxoid; p2; p30; antigen.

The method involves effecting uptake and processing by antigen presenting cells (APCS) in the animal of at least 1 modified CEA polypeptide or of a mucleic acid encoding the modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide to induce a CTL response and an antibody response that targets the autologous CEA. The method is useful in immunizing actively against diseases characterized by cells that express CEA. The present sequence represents a modified human CEA polypeptide that has tetanus toxoid (TT) P2 and P30 epitopes introduced
                                                                                                                                                                   Inducing an immune response in humans against autologous carcinoembryonic antigen (CEA) comprises administering a modified CEA polypeptide, a nucleic acid encoding the polypeptide, or a microorganism expressing the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CEA; immune response; carcinoembryonic antigen; antigen presenting cell; APC; cytostatic; vaccine; human; tetanus toxoid; p2; p30; antigen.

The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (115) and tumnour necrosis factor alpha (TNF, TNFalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TNFalpha variant protein with an inserted tetanus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                                                       New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          64.0%; Score 119; DB 6; Length 194;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                   The invention relates to inducing an immune response against autologous carcinoembryonic antigen (CEA) in a animal, e.g. human. The method involves effecting uptake and processing by antigen presenting cells (APCs) in the animal of at least 1 modified CEA polypeptide or of a microcrossing or virus expressing the modified CEA polypeptide or of a microcrosganism or virus expressing the modified CEA polypeptide or of a microcrosganism or virus expressing the modified CEA polypeptide or of a microcrosganism or virus expressing the modified CEA polypeptide or of a microcrosganism or virus expressing the modified CEA polypeptide to induce a CTL response and an antibody response that targets the autologous CEA. The method is useful in immunizing actively against diseases characterized by calls that express CEA. The present sequence represents a modified human CEA polypeptide that has tetanus toxoid (TT) P2 and P30 epitopes introduced
                                         Inducing an immune response in humans against autologous carcinoembryonic antigen (CEA) comprises administering a modified CEA polypeptide, a nucleic acid encoding the polypeptide, or a microorganism expressing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Multimeric protein; interleukin 5; IL5; TNPalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; human; mutant; mutein; variant; tetanus toxoid; epitope.

AAY92650-55 are peptides designed which correspond to the P2 and P30 epitopes with 5 flanking human prostate specific membrane antigen (hPSM) amino acids in each end. The flanking amino acids correspond to the epitope insertion sites 6, 8 and 10. The peptides will be used in, e.g. T cell proliferation assays, but also for ELISA or other in vitro assays.

The claims detail a method for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (i.e. self-proteins), for example, hPSM, herequlin 2 (Herz) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (i) at least 1 CTL (cytotoxic T-1) ymphocyte) group derived from the PA and/or at least 1 B-cell group cell group which is foreign to the animal. Analogues of human PSM, human are least one foreign to the animal. Analogues of human PSM, human are least one foreign T helper epitope (e.g. P2 and/or P30) are also claimed. The method is used to treat prostate/breast or breast cancer when the PA is human PSM, FGF8b and Herz, respectively

(FERR) FARM LAB FERRING AS

Dalum I; Elsner H, Jensen MR, Mouritsen S,

WPI; 1998-594561/50. N-PSDB; AAV68425. Modified human tumour necrosis factor-alpha - comprises immunodominant \mathtt{T} cell epitope, useful in vaccines to treat or prevent TNF-associated diseases, e.g. cancer.

Claim 15; Page 81-82; 134pp; English.

The present sequence represents a modified human tumour necrosis factor-

alpha (TNF-alpha) analogue. The analogues have no residual TNF activity and are immunogenic in a large proportion of the human population (by using promiscuous epitopes). The TNF-alpha analogue is able to generate, in humans, neutralizing antibodies to wild-type human TNF alpha, has at least one fragment of TNF substituted by a peptide containing an immunodominant T-cell epitope, and at least one TNF-alpha B-cell epitope. The substitution causes a significant change in the amino acid sequence of any one of the strands in the front beta-sheet, any of the connecting loops or any of the B', I or D strands in the back beta-sheet. The TNF-alpha analogues are used as vaccines for treatment or prevention of diseases associated with excessive release or activity of TNF-alpha, e-grheumatoid arthritis, Crohn's disease, ulcerative colitis, cancer of any sorth.

Novel vaccine composition for prevention/treatment of self-protein-mediated pathology such as cancer, diabetes and asthma, comprises modified immunogenic self-protein and surfactant capable of acting solubilizer.

Claim 21; Page 42-43; 55pp; English.

The invention provides a pharmaceutical vaccine composition (1) for the prevention or treatment of a self-protein-mediated pathology. The composition comprises at least one modified immunogenic self-protein (selected from modified TNP-alpha proteins) and a surfactant capable of eaching as a solubitzer. (1) is useful for preventing or treating a self-protein-mediated pathology such as an inflammatory disease, rheumatoid arthritis, an inflammatory bowel disease (ulcerative colitis or Crohn's

The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       tumor associated peptide
disease), cancer, cachexia, multiple sclerosis, diabetes, psoriasis, osteoporosis or asthma. (I) is useful for inducing autoantibodies to a self-protein such as TNF (tumour necrosis factor)-alpha in a human subject. (I) comprising cetylpyridinium chloride as a component is useful for immunisation of a human subject or for treatment of a human inflammatory disease. The present sequence represents a human TNF-alpha

human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producting cells (AFC8) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-1ymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the PA and/or at least 1 B-cell group derived from the foreign to the animal. Analogues of human PSM, human Her2 and human/murine PGR8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Her2, respectively. Note: This sequence was constructed the smoothing in the smoothing the stream of the symptom of the smoothing the stream of the smoothing that the smoothing the stream of the smoothing that the smoothing the smoothing that the smoothing the smoothing the smoothing that the smoothing that the smoothing the smoothing the smoothing the smoothing that the smoothing the

antigen (PSW) constructs, which contain foreign epitopes (P2 and/or P30).

The immunogenic analogues of PSM can be used in the claimed method as an autocative to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide immune responses against weakly immunogenic cell-associated peptide thuman prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibrobast growth factor 80 (PGP80). The method comprises effecting simultaneous presentation by antigen (PSM), heregulin 2 (Her2) and/or simultaneous presentation by antigen producing cells (APC8) of the animals immune system of: (1) at least 1 acell group derived from the PA and/or at least 1 acell group derived from the PA and/or at least 1 acell group derived from the PA and/or at least 1 acell group which is foreign to the animal. Analogues of human PSM, human Her2 and produced CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to reat prostate, prosta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Osteoprotegerin ligand, OPGL, osteoprotegerin, osteoclastogenesis, tumour necrosis factor receptor; type II transmembrane protein, osteoclast differentiation; CSF-1, osteoclast activator; immune response; osteoporosis; bone resorption.

The present sequence represents fusion protein of murine osteoprotegerin cligand (OPGL) and tetamus toxoid P30 epitope. Osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclast commendation is dependent manner. The OPGL protein is synthesised as a type II transmembrane protein. The murine and human OPGL polypeptides are 87% homologous OPGL is a potent osteoclast of inferentiation for the new protein combined with CSP-1. It is not capable of differentiation at the combined with the absence of CSF-1. OPGL is also inducing osteoclast differentiation in the absence of CSF-1. OPGL is also are civator of mature osteoclasts. The specification describes a method comprises using at least one OPGL polypeptide or subsequence, and/or at least one OPGL polypeptide or subsequence, and/or at least one OPGL polypeptide or subsequence, and/or at meniorating osteopoxosis or other diseases or conditions characterised by excessive bone resorption
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ۲;
                                                                                                                                              In vivo down-regulation of osteoprotegerin ligand (OPGL) activity used to treat, prevent and ameliorate osteoporosis.

The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and turnour necrosis factor alpha (TMF, TWRSIDha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in 2 near therapy. The present sequence is a fusion construct which comprises 2 human interleukin 5 (IL5) monomers joined by tetanus toxoid epitopes 100 and P2. This sequence is used to illustrate the method of the invention
                                                                                                                                                                      New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                   Claim 20; Page 112-113; 196pp; English.

pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A; Molecule type: protein
A; Residues: 2-31 < DEF>
C; Comment: The source of this protein was an extrachromosomal plasmid.
C; Comment: The source of this protein was an extrachromosomal plasmid.
C; Comment: The precursor is cleaved by endogenous proteinase activity to form light (fradual chains are not toxic when separated). The amino end of the heavy chain (fragment B; Comment: Fragment D forms ion channels in a lipid bilayer. Fragment C binds to ganglic C; Comment: This potent neurotoxin binds to peripheral neuronal synapses, is internalized presynaptic neurons. It inhibits neurotransmitter release by proteolytic cleavage of sy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A)Description: blocks neuroexocytosis via hydrolysis of a Gln-Phe peptide bond in synapt C; Superfamily: tetanus toxin C; Superfamily: tetanus toxin C; Superfamily: tetanus toxin C; Seywords: hydrolase; metalloproteinase; neurotoxin; transmembrane protein; zinc C; Seywords: hydrolase; metalloproteinase; neurotoxin; transmembrane protein; zinc P; 24-1315/Product: tentoxylysin heavy chain (fragment B.C) #status predicted <TIL> F; 461-864/Domain: channel forming (fragment B) #status predicted <TXB> F; 565-1315/Domain: ganglioside binding (fragment C) #status predicted <TXC> F; 233, 237/Binding site: zinc (His) #status predicted

10-OCT-2003 (Rel. 42, Last annotation update)
15-tanus toxin precursor (EC 3.4.24.68) (Tentoxylysin) [Contains:
15-tanus toxin light chain (Tetanus toxin chain L); Tetanus toxin heavy
chain (Tetanus toxin chain H)].
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PARTIAL SEQUENCE, AND DISULFIDE BONDS.

AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD WHERE IT CAN MOVE BETWEEN POSISYNAPTIC AND PRESYNAPTIC NEURONS. IT INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC ENDOPERTIBASE THAT CARLIZES THE HYDROLYSIS OF THE SHGIN-|-LYS-59 BOND OF SYNAPTOREVINS-1 AND -2.

CC -1- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocycosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates.

CC -1- COFACTOR: Binds 1 zinc ion per subunit (By similarity).

CC -1- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a heavy chain partial the heavy chain activity.

While the N- and C-terminal of the heavy chain mediate channel CC while the North Cordinors of SUBCELLULAR LOCATION: Secreted Activally.

"Nucleotide sequence of the gene coding for Clostridium botulinum (Clostridium argentinense) type G neurotoxin: genealogical comparison with other clostridial neurotoxins.";
Biochim. Biophys. Acta 1216;487-491 (1993).
FINCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES. IS INTERNALIZED AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPIRAL CORD WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT INHIBITS. NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
                                                                                                                                                                                                                                                                                                                                                                          --- CATALTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates.

--- CORACTOR: Binds 1 zinc ion per subunit (By similarity).

--- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a heavy chain (H). The light chain has the pharmacological activity, while the N - and C-terminal of the heavy chain mediate channel formation and toxin binding, respectively.

--- SUBCELLULAR LOCATION: Secreted (By similarity).

--- MISCELLANSOUS: There are seven antigenically distinct forms of botulinum neurocoxin: Types A, B, Ci, D, E, F, and G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               BOTULINUM NEUROTOXIN G, LIGHT-CHAIN.

Virus Res. 53:53-73(1998).

-!- FINCTION: THE VIRUS PARTICLE OUTER CAPSID. IT IS THE MAJOR TARGET OF THE HOST IMMUNOGENIC RESPONSE.

-!- SIMILARITY: Belongs to the recoviruses VP2 protein family.
                                                                                                                                                                                                                                                                                                                                               GONADOLIBERIN I.

-!- SUBCELDULAR LOCATION: Secreted.
-!- SUBCELDULAR LOCATIONY: Forebrain.
-!- TISSUB SPECIFICITY: Forebrain.
-!- DEVELOPMENTAL STAGE: Expressed at significantly higher levels during post-breeding. Not expressed in pituitary.
-!- SIMILARITY: Belongs to the GRRH family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Rana catesbeiana (Bull frog).
